

The RISC Spaced Learning Platform

Spaced Learning, or “spaced review,” delivers small, repetitive pieces of content over a period of time with breaks between the sessions. For example, you might deliver nine micro-learning modules, one every 2-3 days over a period of 3 weeks. Each of the modules will repeat much of the learning content from the previous module while adding a bit of new content. There is compelling scientific evidence that spacing of repetitive content can significantly improve cognitive retention. Unfortunately, most LMSs do not support spaced learning. For this reason, RISC is introducing the Spaced Learning Platform (SLP).

Benefits of Spaced Learning

With Spaced Learning you get:

- **Higher student satisfaction.**
Students' work schedules are only minimally interrupted. Instead of spending several hours dedicated to learning, they may only spend a few minutes per day.
- **Better retention.**
There is a significant amount of research supporting the idea that students retain information longer when there are breaks between learning.

Utilize Spaced Learning outside your LMS

With SLP you can deliver multi-lesson Spaced Learning courses to your students without changing your LMS. Your students will receive text messages or emails alerting them to complete a learning module. You're also able to set up reminder alerts. After completion of the first module, the SLP will send a link to the next lesson after a defined number of days.

In addition to learning content, the SLP can deliver one or more online tests to your students to check for comprehension. Post-training surveys or course evaluations may also be sent to students for feedback.

Does it work with any micro-learning content?

In order for SLP to track completions, your content must use either xAPI or cmi5. You can develop the content in any authoring tool that supports one of these specifications. If you prefer, RISC can develop the content for you with our partner companies.

How do I get results?

The SLP regularly sends reports showing the progress of students through your Spaced Learning course. If desired, data can be provided in a format for importing to your LMS, or an API is available for a more integrated solution.

How do I get started?

Contact us to discuss the details of your project needs.
